Iteration 1 Progress Report

Difficulties: Some difficulties presented so far included getting started with an idea. We swapped back and forth between an alternative project idea and the given TA one and eventually agreed the TA template would suit our team best. We had little trouble getting the backend up and running as the SmileApp prepared us very well in terms of coding experience.

Features: All features required by the Project Description document found on BlackBoard are implemented. This includes the mock interfaces for creating both Student and Instructor accounts, logging in, viewing a profile, and adding a course. A user can successfully create a new Instructor or Student account. We also implemented a WSU Crimson and Gray themed UI, adding the WSU logo to the red banner on the left of the page. There are no features we did not implement as planned, and we did not leave any required features for a further iteration.

Tests: We performed simple tests with Postman and our own playing around. To make sure the new profiles were being sent to the backend, we ran the backend and created fake accounts, then looked up their stats both in the console and on Postman. We interacted with the GUI and made sure all the buttons worked as they should and hid the correct forms as the user navigates around.
